

How does our food grow?

Plants are an important source of food - but where do they come from?

- Most plants grow from seeds - when they are mature enough, they will produce more seeds that will grow into more new plants
- Some plants develop from bulbs - these are swollen portions of roots or stems

Different seeds and bulbs will grow into different plants.

Can you match the seeds and bulbs to the edible plants they grow into?

EDIBLE PLANTS

SEEDS AND BULBS

Popcorn kernels

Pumpkin seeds

Garlic bulb

Avocado seed

Coffee beans

Apple seeds

Onion bulbs

Cucumber seeds

Pea seeds
